A new era for the electronic signature

A new era begins for the electronic signature: DeepCloud introduces DeepID digital identity combined with DeepSign.

WITTENBACH, SWITZERLAND

In today's highly digitalised environment, electronic signatures are spreading fast, yet with a growth that is still not reaching the mass at the expected rate. So far, the main limiting factor for e-signatures was the complexity of the digital identification process which required to be physically present or download third-party applications mostly with a fee payment.

Thanks to the introduction of DeepID, the Swiss tech company DeepCloud is now changing the rules by fully digitalising the identification flow through a free-of-charge native integration with its e-signature solution DeepSign.

"The DeepID app is indeed a game changer, as it finally allows users to create their digital identity remotely, quickly and free of charge. And thanks to DeepSign, everyone in Switzerland and the EU can now legally sign documents online in a matter of minutes." said Andrea Bogoni, Chief Marketing Officer of DeepCloud.

eSignature for all with DeepSign.

DeepSign is the Swiss-made electronic signature solution simple to use, legally compliant, and now affordable for everyone.

With DeepSign users can create three types of legally recognised electronic signatures: qualified electronic signature (QES), advanced electronic signature (AES) and simple electronic signature (SES), in line with Swiss and European standards.

Thanks to the native integration between DeepSign and DeepID one can obtain a qualified electronic signature fully remotely in just a few minutes.

DeepSign is available with the lowest pricing plans in the industry on a pay-per-use basis. Corporate packages and integrations with multiple business software solutions are also available.

Simple and free digital identification with the DeepID app.

DeepID is the simple and free digital identification solution that helps users verify their identity in a quick and convenient fashion just using their ID. DeepID is based on a highly accurate photo and video recognition technology to verify the identity of users in a very simple way. It also uses reliable document scanning to ensure no one can use a fake ID or passport. Data security is ensured by state-of-the-art technical features, data storage on secure Swiss servers and processes complying with Swiss (ZertES) and European (eIDAS) standards. The DeepID app is available on iOS and Android.
